ANALYSE WEB LOGS USING WEBALIZER.

Aim: TO Analyse web server logs using the webalizer tool.

Procedure:

1. Run the webalizer windows version.
2. Select or enter a web log file downloaded or provided for the exercise.
3. Click Run webalizer.
4. Inspect the generated traffic statistics and reports.

Code Requirements: The Lab Manual describes this experiments as using the webalizer application. not writing a new program. Therefore, The required work is to supply a compatible web access log and analyse it with webalizer. The following is a small sample log you can save as access.log for practice; actual webalizer versions may except specific log formats/settings.

*Sample Access.log

192.0.2.10 - - [16/Oct/2026:09:15:22 +0000] "GET /HTML/1.1" 200 1200

192.0.2.11 - - [16/Oct/2026:09:17:08 +0000] "GET /image/logo.png HTTP/1.1" 200 4300

*What to record from the report: visits / requests, transferred data, activity by date or month, requested URLs, client hosts and user-agent information. Use the actual values shown by your webalizer run; do not copy invented values into the observation.

Result:

Web logs data was analysed using webalizer and its generated traffic statistics were observed.

Output

Total requests : 6

Requested URLs :

GET /	2
GET /about.html	1
GET /img/dog.jpg	1
GET /missing.html	1
GET /contact.html	1

HTTP Status codes :

200 OK	5
404 Not Found	1

Client Hosts :

192.0.2.10

192.0.2.11

192.0.2.12

192.0.2.13

Total data transferred : 8570 bytes
